

During each of the tests, the user will be asked to perform the following tasks:

Tasks	Description
1. The user asks a simple yes or no question.	The user either audibly asks a yes or no question, or types it in the chat, and then enables the application to record the chat for the participants' answers.
2. The user can look at what his data looks like in multiple formats before choosing a visualization.	Before the user displays the results of their question to the participants, they can see how the results would appear in the different formats that are available to them.
3. The user can manually customize and/or fix charts.	If the user wishes to remove one of the options from the chart or to simply change the appearance of it, they can do so by clicking on the appropriate button.
4. The user can select/find the alternative chart types to view data.	The user can easily view and access the different chart types that are supported by the application to present the data obtained.
5. The user can find/interact with/follow zoom chat within our application.	The user has full access to the chat within the application, instead of having to go back and forth between Zoom and the application to use it.
